WFS1 M518V — Wolframin

Methionine → Valine at position 518. Cytoplasmic loop 4. ClinVar Uncertain significance, AlphaMissense 0.749, DynaMut2 ΔΔG -0.69 kcal/mol (destabilising).

IDENTITY

Variant	M518V (p.Methionine518Valine)
DNA change	c.1552A>G
Gene · Protein	WFS1 · Wolframin (890 aa)
UniProt	O76024 · WFS1_HUMAN
ClinVar accession	VCV000229637
Amino acid change	Methionine (M) → Valine (V)

STRUCTURAL CONTEXT

AlphaFold model	AF-O76024-F1, v6
pLDDT at residue 518	**84.12** HIGH CONFIDENCE
Domain	Cytoplasmic loop 4
Position context	Loop region · position 518 sits between transmembrane segments, solvent-accessible
IDR flag	No — pLDDT well above 50 threshold

> Position 518 sits in a connecting loop between transmembrane helices. Loop residues are typically solvent-exposed and often contribute to interhelical contacts or serve as recognition sites for binding partners. The wild-type residue is hydrophobic sulfur (methionine); the mutant is small hydrophobic (valine — branched). The chemistry shift implies altered local packing, hydrogen-bonding, and/or electrostatics at this site.

Category 3/4 — Most Druggable

|ΔΔG|=0.69 < 2 kcal/mol (fold intact) + AlphaMissense 0.749 confirms functional impact. Specific local contacts disrupted — priority for docking and pharmacological chaperone screening.

Wolframin's fold survives this substitution (|ΔΔG|=0.69 kcal/mol). The pathogenic signal is real — AlphaMissense places it at 0.749. Protein still folds, but a specific local site is broken. Pharmacological chaperones and small-molecule binders are the rational therapeutic vector.
